

AI WITHOUT FEAR

Understanding AI without hype, panic or blind trust.

What are you afraid of?

AI will take my job.

AI will make people stupid.

AI will destroy creativity.

AI will destroy democracy.

AI will become uncontrollable.

AI will improve my life.

I don't know what to believe.

Stop saying “AI”

AI is an umbrella term.

MODEL

APPLICATION

AGENT

AUTONOMOUS SYSTEM

REAL-WORLD CONSEQUENCES

The AI loop

DATA → MODEL → OUTPUT → HUMAN / SYSTEM ACTION → FEEDBACK

AI is part of a larger system.

Data • training • evaluation • software • permissions • users • institutions

Why does AI sound intelligent?

AI can produce remarkably fluent language and solve difficult tasks.

But:

FLUENCY $\neq$ TRUTH

CAPABILITY $\neq$ RELIABILITY

CONFIDENCE $\neq$ KNOWLEDGE

Do not infer human-like consciousness or intention from conversational fluency.

Capability ≠ Reliability

The right question is not:

“Can AI do this?”

Ask instead:

“What level of trust is appropriate for this task?”

Brainstorming → review

Learning → verify

High-stakes decisions → independent evidence + appropriate human oversight

The hallucination problem

PLAUSIBLE ≠ TRUE

AI can generate:

- incorrect facts
- invented citations
- fabricated quotations
- false explanations

The danger is often not that the answer sounds absurd — it is that it sounds reasonable.

AI LAB — Trust, Test, Verify

8 min — Hallucination Hunt

1. Ask for factual claims + sources.
2. Pick one claim.
3. Verify using an independent source.
4. Record what happened.

Then:

4 min — Change the prompt

2 min — Share observations

BREAK

10 minutes

Question on screen:

“If an AI can imitate intelligence, what exactly are humans contributing?”

Who controls AI?

DATA

COMPUTE

MODELS

COMPANIES

APPLICATIONS

INSTITUTIONS

SOCIETY

Five ethical questions

1. CONSENT — Was data used appropriately?
2. FAIRNESS — Who may receive worse outcomes?
3. ACCOUNTABILITY — Who is responsible when it fails?
4. TRANSPARENCY — Can people understand or challenge decisions?
5. POWER — Who controls deployment and who bears the consequences?

Four categories of AI risk

INDIVIDUAL

Privacy • fraud • manipulation • discrimination

INSTITUTIONAL

Bad decisions • surveillance • weak oversight

SOCIETAL

Misinformation • labor disruption • concentration of power

CATASTROPHIC / EXISTENTIAL

Possible future failures of highly capable systems

ETHICS LAB — What would responsible look like?

Choose one scenario:

Hiring AI

AI companion

Workplace automation

Synthetic media

Creative work

Discuss:

Who benefits?

Who may be harmed?

Who decides?

What safeguards are needed?

Who is accountable?

AI WITHOUT FEAR • 13/18

Generalsoft FZ-LLC
Proud member of RAKEZ

Possibility ≠ Probability

When you hear:

“AI could destroy humanity.”

Separate:

OBSERVED

DEMONSTRATED

PREDICTED

SPECULATED

Then ask:

What evidence supports the claim?

What assumptions connect the steps?

What would change our minds?

Who said it? Why? Evidence?

When evaluating an extreme AI claim:

1. WHO is saying it?
2. WHAT exactly are they claiming?
3. WHAT is the evidence?
4. WHAT assumptions are required?
5. WHAT interests or incentives surround the claim?
6. WHAT would change our minds?

A real case: AI agents & cybersecurity

CASE STUDY

An autonomous AI-agent system was involved in a 2026 intrusion affecting Hugging Face infrastructure.

Questions:

- What actually happened?
- What capabilities were involved?
- What permissions existed?
- What did humans design?
- What does the incident demonstrate — and what does it NOT demonstrate?

You are not a passenger

Technology evolves.

Institutions evolve.

Jobs evolve.

Laws evolve.

Culture evolves.

People adapt.

The future is not merely something we predict.

It is something people participate in creating.

Your AI Constitution

I will use AI for: _____

I will verify AI output when: _____

I will not give an AI unrestricted access to: _____

When I hear an extreme AI claim, I will ask: _____

One thing I want to learn about AI is: _____
